

Cypress Cortex R4 Family

CMOS

MB9DF126 Series

MB9DF126, MB9DF126B

DESCRIPTION

MB9DF126 series is based on Cypress's advanced ARM architecture (32-bit with instruction pipeline for RISC-like performance). Improvements compared to the previous generation include significantly improved performance at higher frequency, reduced power consumption and faster start-up time.

For highest processing speed at optimized power consumption an internal PLL can be selected to supply the CPU with up to 128MHz operation frequency from an external resonator.

■ **REVISION HISTORY**

Version	Date	Remark
0.01	2010-08-12	Initial draft
0.02	2010-08-24	Updated according to latest short spec
0.03	2011-01-27	Updated Overview, Memory Map, Package and Pin Assignment, Interrupt/DMA chapter with relevant information. Removed Recommended settings chapter.
0.04	2011-02-01	Updated Electrical characteristics chapter and modified the document footer.
0.05	2011-02-04	Updated Block diagram with CRC, Overview, Table 2-1, Table 3-2, Table 4-1, Table 4-3, Table 6-1, Table 6-3, Figure 6-3, Table 6-4, Table 6-5, Table 6-9, Table 6-11, Table 6-14, Figure 6-8. Renamed Pnn_m to Pi_jj.
0.06	2011-02-15	Updated Document code. Updated Figure 3-2, Table 3-1, and Section 3.3.2
0.07	2011-03-10	Updated QFP-296 diagram, QFP-296 Package pinout table, Pin circuit type of QFP-296, I/O circuit types.
1.00	2011-03-18	Updated IO_MAP.
1.01	2011-03-31	Updated Table 6-5 with PLL information and modified Table 2-2.
1.02	2011-04-06	Updated Section I/O Pins and their functions and I/O Pin Types.
1.03	2011-05-04	Added RICFG information in Section 3.2.2. Added Procedures chapter. Renamed EEFLASH in Memory and Config(MEMORY_CONFIG)AHB Bus Memory Map
1.04	2011-05-13	Renamed APIX power supply pins in QFP-296 Package diagram and QFP-296 Package pinout table.
1.05	2011-05-27	Added Section Master ID.
1.06	2012-05-04	Added Input Level Description and Drive Strength Information. Corrected IO circuit diagrams, ID value and reference supply in DC characteristics. Added current consumption values
1.07	2012-07-02	Added handling devices, ordering information, flash programming times.
1.08	2012-07-10	Added RC Oscillator Frequency, modified Characteristics to match evaluation results. DMA channel registers limited to 8.
2.0	2012-08-21	No longer preliminary revision
2.1	2012-12-13	Trademark note added, Support note removed, package information updated, std version for Warning, back cover changed, boundary scan chapter updated, new HSSPI timing, ADC reference values

Version	Date	Remark
2.2	2013-02-08	Corrected TC-Flash ID in table 2-14: List of Module ID Updated IO circuit type JTAGO and SDIN/SDOUT/RREF in table 3-3 Changed item name of table 4-3 Modules with DMA Corrected reset value of PPC_PCFGR040 ~ PPC_PCFGR123 in table 5-6 memory layout for the PERIO_RBUS registers Updated pin, condition, value and remarks of DC characteristics in table 6-3 Extended 7.1 Boundary Scan chapter. Updated 8.4 Power on sequence Added 8.5 Pin State while Power-On-Reset Added MB9DF126BPMC-GSE2 to 9.Ordering Information
2.3	2013-06-19	Specified APIX leakage current of ICCPSS in table 6-3 Changed condition of ICCPSS for PD2 and PD3 in table 6-3
2.4	2013-06-28	Corrected condition of ICCPSS for PD2 and PD3 in table 6-3 back to version 2v1
3.0	2013-07-01	Added figure 3-2: Package Dimensions QFP-296 Corrected order information in chapter 9. by updating partnumber for QFP-296 variant and removing unnecessary "*" marks from part number
4.0	2014-01-31	corrected number of MPU channels from 8 to 12, corrected name of QFP176 package pin 127 from VSS5 to VSS, extented remark for PD1 run mode current, removed precondition from flash program/erase cycle and data retention time, corrected HTM trace sources with ID2, corrected part-number for QFP-296
4.1	2015-10-28	Updated electrical specifications per PCN: 2901. DC Characteristics, Power supply current in PSS mode DC Characteristics, Power supply current in Timer mode In addition, updated document from Fujitsu look and feel to Cypress. Cosmetic changes only.

2.2 Features

Table 2-1: Feature

Feature	Description
Technology	<ul style="list-style-type: none"> • 90nm CMOS with embedded flash
Processor Subsystem	<ul style="list-style-type: none"> • Cortex R4 CPU core • 32-bit ARM architecture, dual-issue superscalar eight stage pipeline • ARMv7 and Thumb-2 instruction set compliant • Memory Protection Unit (MPU) with 12 regions • Two Tightly Coupled Memory (TCM) ports. 64-bit AXI slave port for access to TCMs • 64-bit AXI master port • Vectored Interrupt Controller (VIC) port for faster interrupt processing • Single error correction, double error detection (SECDED) Error Correction Coding (ECC) for memory error detection and correction • Instruction cache: 8KB 4-way set-associative • Data cache: 8KB 4-way set-associative • Up to 8 break-points and 8 watchpoints
Debug and Trace	<ul style="list-style-type: none"> • ARM Coresight technology • Standard 5-pin JTAG interface • 4-bit, 8-bit, 16-bit, and 32-bit trace data width supported depending on package • Secure entry supported for debugger
Clocks	<ul style="list-style-type: none"> • External main clock of 4MHz (up to 8MHz under evaluation) • External sub clock (typical 32.768 kHz) • Embedded RC oscillator (typical 8/12 MHz, configurable) • Embedded Slow RC oscillator (typical 100 kHz) • On-chip Phase Locked Loop (PLL) clock multiplier for main clock, Spread Spectrum Clock Generation (SSCG) • Stabilization timers for all source clocks
Clock Supervisor	<ul style="list-style-type: none"> • Clock supervision for all source clocks and PLL outputs • Reset generation for out-of-bound clock frequencies on input source clocks, or PLL output clocks
Resets	<ul style="list-style-type: none"> • Power on Reset (PoR) • External Reset • Software triggered hard reset • Clock supervision resets • Watchdog • Low Voltage Detection reset • Software reset

Table 2-1: Feature (Continued)

Feature	Description
Watchdog Timer	<ul style="list-style-type: none"> • 32-bit counter • Supports selection of four clock sources (Main clock, Sub clock, RC clock or Slow RC clock) • Support for window watchdog functionality • Reset or NMI generation support on watchdog errors • Support for preemptive warning interrupt before watchdog reset or NMI generation • Additional safety provision through three times redundancy and error correction logic for important configuration bits • Option to halt watchdog counter in case of core reaching break-point
DMA	<ul style="list-style-type: none"> • 64-bit AHB Master Interface • 32-bit AHB Slave Interface • Block, burst and demand transfer modes • Fixed and incremental addressing for source as well as destination • 132 clients • 8 channels to handle independent data flows • Fixed priority, dynamic priority, and round robin arbitration
Interrupts	<ul style="list-style-type: none"> • Interrupt Request (IRQ) and Fast Interrupt Request (FIQ) capability • NMI sources can generate FIQ • Supports 32 Non Maskable Interrupt (NMI) source for FIQ generation • Supports 512 Normal Interrupt sources for IRQ generation • Supports request for low power mode entry • Programmable 32-level priority controller for normal IRQ sources. Also, supports programmable priority level masking • Programmable 16-level priority controller for NMI interrupt sources • Software interrupt generation • Privileged mode support for restricted access
External Interrupts	<ul style="list-style-type: none"> • Up to 32 pins can be used as external interrupts • Optional 25ns (typical) noise filters on all lines • DMA support • NMI support • Five polarity support ('H', 'L', rising edge, falling edge, and, any edge) • Event capture support for all 32 external interrupt pins • Software enabled monitoring of external events, with sampling frequency of 500Hz to 16MHz
Timing Protection	<ul style="list-style-type: none"> • Up to eight identical 24-bit timers for execution time protection, locking time protection, inter-arrival time protection or deadline protection • Normal and overflow mode support • Global linear prescaler (1 to 64) to scale down clock frequency • Additional, individual timer prescaler to support 4 different software programmable frequencies (1, 1/2, 1/4, and 1/16) • Start, stop, and continue options per timer controllable by software

Table 2-1: Feature (Continued)

Feature	Description
Memory Protection	<ul style="list-style-type: none"> • Memory protection unit for all bus masters • AXI interface support • 8 programmable memory regions, and one background region which covers entire 4GB address space • Unauthorized access generates NMI
Peripheral Protection	<ul style="list-style-type: none"> • Protection to all peripherals and General Purpose IOs (GPIO) • Individual protection setting for up to 512 peripherals, and 512 GPIO channels • DMA access support for faster register configuration
CAN	<ul style="list-style-type: none"> • Supports CAN protocol version 2.0 part A and B • Bit rates up to 1 Mbps • 64 message objects • Each message object has its own identifier mask • Programmable FIFO mode (concatenation of message objects) • Maskable interrupt • Disabled automatic retransmission mode for time triggered CAN applications • Programmable loop-back mode for self-test operation
USART/LIN	<ul style="list-style-type: none"> • Programmable LIN or USART function • Full-duplex support • Clock synchronous (start-stop synchronization and start-stop-bit option), and Clock asynchronous (using start-, stop-bits) transfer modes • Dedicated baud rate generator. Mechanism for automatic baud rate adjust available in LIN mode • Support for data length of 7-bits (not in synchronous or LIN mode) and 8-bits • Support for signal modes Non-Return to Zero (NRZ) and Non-Return to Zero Inverted (NRZI) • Reception error detection for framing, overrun, parity, checksum, sync field timeout, and frame-ID (only in LIN mode) errors • Interrupt capability for transmission, reception, and errors • DMA support
I2C	<ul style="list-style-type: none"> • Master/slave transmitting and receiving functions • 7-bit addressing as master and slave • 10-bit addressing as master and slave • Acknowledge disable option upon slave address reception (master-only operation) • Address mirroring to give interface several slave addresses • Up to 400 kbps transfer rate • Optional noise filters for SDA and SCL • Interrupt capability on transmission and bus error events
Stepper Motor Control	<ul style="list-style-type: none"> • PWM duty cycle programmable from 0% to 100% • Programmable setting to select 'L', 'H', 'PWM' and 'HighZ' output • High current output pins

Table 2-1: Feature (Continued)

Feature	Description
A/D Converter	<ul style="list-style-type: none"> • 50 channels • Conversion time: 1us per channel • RC type Successive Approximation (SAR) with sample and hold circuit • 10-bit or 8-bit resolution • Program selection analog input from 32 channels • Single conversion, continuous conversion, and scan conversion options • Interrupt capability • DMA support • 4 range comparator channels for comparing conversion output with thresholds
I2S	<ul style="list-style-type: none"> • Programmable master/slave operations • Supports transmission only, reception only and simultaneous transmission/reception operations • Support for 1 sub frame and 2 sub frame constructions • Up to 32 channels supported in each sub frame • Support for individual configuration of channel number, channel length, word length in each sub frame • Word length support from 7-bits to 32-bits • Programmable frequency, polarity, and phase of frame synchronous signal • Programmable sampling point of received data (center or at the end of received data) • Support for frequency division from 1 to 126 in multiples of 2 • DMA support • Interrupt capability
Sound Generator	<ul style="list-style-type: none"> • Produces sound/melody with varying frequency and amplitude • Square wave sound output with frequency of 100Hz – 6kHz (resolution 20Hz) • Programmable Pulse Width Modulated (PWM) cycle width of 255 or 511 clocks. PWM duty cycle programmable from 0% to 100% • Two 2-bit prescaler with programmable clock division of 1, 1/2, 1/3, and 1/4 • Automatic linear or exponential amplitude increment or decrement • Start, stop, resume functionality • DMA support • Automatic sound output stop when amplitude becomes 0
Up Down Counter	<ul style="list-style-type: none"> • Format: 32-bit or 2 times 16-bit • Three count modes (timer mode, up/down count mode, and phase difference count mode) supported • Multiply by 2 or multiply by 4 in phase difference count mode • Count source can be internal clock or external trigger • Counting range: any value between 0 and $2^{32}-1$ can be set • 4 interrupt options (Compare-match interrupt, Underflow interrupt, Overflow interrupt, and Count direction change interrupt)

Table 2-1: Feature (Continued)

Feature	Description
Reload Timers	<ul style="list-style-type: none"> • 32-bit reload counter • External and Internal clock/event source • Trigger signal programmable as rising/falling edge or both • Gated count function • One-shot or reload counter mode • Counter state can be made visible at external pin • Prescaler with six different settings for the internal clock and two settings for the external clock • Several Reload Timers can be cascaded to form a longer Reload Timer • DMA support
Free Running Timers	<ul style="list-style-type: none"> • Signals an interrupt on overflow, match with Compare registers, zero-detection, or match with Compare Clear Register • Option to mask zero detection, compare clear match interrupt, or both to allow for interrupt generation only after multiple events • Programmable timer period up to 1 s • Support for 11 counter clocks. Prescaler with 1, 1/2, 1/4, 1/8, 1/16, 1/32, 1/64, 1/128, 1/256, 1/512, and 1/1024 of peripheral clock frequency • DMA support
Input Capture Units	<ul style="list-style-type: none"> • Consists of 2 independent input channels • 16-bit wide capture registers per channel • Signals an interrupt upon external event • Rising edge, falling edge or rising & falling edge sensitive • DMA support
Output Compare Units	<ul style="list-style-type: none"> • Consists of 2 independent channels • 16-bit wide • Signals an interrupt when a match with 16-bit I/O Timer occurs • A pair of compare registers can be used to generate an output signal • Interrupt capability
Programmable Pulse Generator	<ul style="list-style-type: none"> • 16-bit down counter, cycle and duty setting registers • Interrupt at trigger, counter borrow and/or duty match • PWM operation and one-shot operation • Internal prescaler allows 1, 1/4, 1/16, 1/64 of peripheral clock as counter clock and Reload timer underflow as clock input • Can be triggered by software or reload timer
Real Time Clock	<ul style="list-style-type: none"> • Can be clocked from main clock, sub clock or RC clock • Automatic calibration support even when device is in low power state • Interrupt capability on half-second, 1 second, 1 minute, 1 hour, and 1 day duration • Additional capability for interrupt generation on calibration failure detection and calibration done event • Auto calibration of Sub clock or RC clock with respect to Main clock • Separate clock selector for calibration • Configurable calibration duration • Auto/manual trigger for calibration

Feature	Description
Internal Memories-TCMRAM	<ul style="list-style-type: none"> • 128 KB • 64-bit interface • Single error correction, double error detection (SECDED) ECC support
Internal Memories-System RAM	<ul style="list-style-type: none"> • 64-bit AXI interface • 64 KB • Single error correction, double error detection (SECDED) ECC support • Parallel read/write capability for 2 different banks
Internal Memories-Retention RAM	<ul style="list-style-type: none"> • 16 KB • 4 banks • 32-bit AHB • Low leakage RAMs for low power consumption
Tightly Coupled Flash Memory	<ul style="list-style-type: none"> • 2 MB • Parallel Programming support • Mapped to TCM address space as well as Cacheable address space through AXI interface • Single error correction, double error detection (SECDED) ECC support • TCM address space supports only read access • Cacheable AXI address space supports write and read access • Detection of hang-up 1 state • 32 large sectors of 64KB each • 16 small sectors of 8KB each • Sector-wise access protection for write and read accesses
EEPROM Emulation Flash Memory	<ul style="list-style-type: none"> • 64 KB • Parallel Programming support • Single error correction, double error detection (SECDED) ECC support • Support for sector erase • EEPROM emulation mode support • Support for mirroring of memory in 3 diverse memory-mapped regions • 8 sectors of 8KB each • Sector-wise access protection for write and read accesses
Quad SPI	<ul style="list-style-type: none"> • Supports legacy as well as the dual-bit and quad-bit modes of SPI operation • Supports up to four slave devices in master mode • Programmable transfer rate, active-level of slave-select signal, polarity, and phase of the serial clock per slave select • Support for memory mapped operation of external serial flash and serial SRAM devices in command sequencer mode • Additional direct mode support for standard SPI operation through FIFO interface
Error Collection	<ul style="list-style-type: none"> • Error collection on all peripherals • Optional Non-Maskable Interrupt (NMI) generation capability
Low Voltage Detect	<ul style="list-style-type: none"> • Low voltage detection for 5V, 3.3V, and 1.2V • Programmable thresholds • Reset generation capability on low voltage events

Table 2-1: Feature (Continued)

Feature	Description
I/O Ports	<ul style="list-style-type: none"> • All functional pins can be used as GPIO • Programmable analog or digital functionality selection • Programmable input levels (Automotive, CMOS, and TTL) • Programmable pull-up/pull-down and output drive
EBI	<ul style="list-style-type: none"> • Endianess configuration support for all SRAM interfaces based on chip select • PPU Protection for EBI Configuration register range • Only 32-bit write access support supported by EBI Configuration registers • Lock/Unlock register for write protection for EBI Configuration registers
APIX	<ul style="list-style-type: none"> • Support 500, 250, 125 Mbps pixel data transmission • Support 62.5, 41.67, 31.25, 20.83 Mbps side band data reception • Support loop back test mode (BIST logic) • Monitoring PLL lock detection over Osc clock glitches
ARH	<ul style="list-style-type: none"> • PPU protection for register access • Debug support for RAM • Registers accesses based on Lock status ARHn_RHCTRL:LST bit, ARHn_T-ST:TM bit, on transaction buffer state, and on tx_config from Remote Handler • Arbitration between S/W read and A-Shell write over the event buffer
CRC	<ul style="list-style-type: none"> • Programmable 8, 16, 24 or 32 bit input data width • Programmable polynomial value (Polynomial degree from 2 to 32) • Programmable initial seed value • Programmable final checksum XOR value • Interrupt and DMA client interface • Configurable input/output bit reflection and byte swapping • Supports PPU • Supports block/multiple data transfers (more than 32-bit)
Packages	<ul style="list-style-type: none"> • QFP-296 (evaluation variant with additional trace pins) • QFP-176 (series variant)

2.5 Lock/unlock values for protection units

For various protection and system relevant units, registers must be unlocked before configuring and can be locked for protection. For the details about functionality, see the FCR4 Hardware Manual.

2.6 ID-Values for Module Identification Registers

For several peripheral and system related modules, the hardware contains Module Identification Registers that hold read-only values which contain information about the module number, the version and possible patches.

3 Package and Pin Assignment

3.1 Package

The same die will be used for two packages.

A QFP-176 package is used for MB9DF126. The package code is FPT-176P-M07.

Also an optional QFP-296 package with trace pins is shown in Section 3.1.1. The package code is FPT-296P-M04.

I2C	 <p>The diagram shows an I2C input circuit with a pull-up resistor and a pull-down resistor. The input signal is connected to a node that branches into several OR gates. Each OR gate has one input from the signal node and another from a 'Standby control for input shutdown' signal. The outputs of these OR gates are labeled: Hysteresis input, Automotive input, TTL input, and CMOS input. The output drivers consist of a PMOS transistor (Pout) and an NMOS transistor (Nout). 3.2 I/O Pins and their functions

IO Pin configuration needs to be done by writing into Port Pin Multiplexing registers and Resource Input Configuration registers which are described in Section 3.2.1 and Section 3.2.2 respectively. The access to the PPC_PCF-GR_{ij} registers must be enabled before starting IO Pin configuration by setting the corresponding bit of the GPIO_PPEN_n, where n denotes the port number to which the GPIO_PPEN_n belongs.

Note:

The corresponding GPIO_PPEN_n register bit must be set for both Port Pin Multiplexing and Resource input source-Multiplexing registers. GPIO_PPEN_n can only be written in privileged mode and each byte can be written only once. In privileged mode, access to the PPC registers must be enabled on the PPU channel PPCPRIV (see chapter 4.4).

4 Interrupt / DMA

This section shows the allocation of interrupt and interrupt vector/interrupt register.

4.1 Interrupt table

Table 4-1: Interrupt Table

Interrupt Line No	Interrupt Name	Interrupt Description
0	SYSCIRQ	Status Interrupt from System Controller (SY-SC_SYSSTS:RUNDN is set when current RUN Profile was successfully applied)
1	WDGIRQ	Watchdog pre-warning Interrupt (WDG_INT:IRQ_FLAG is set when watchdog error condition is detected (missing or wrong WDG clearing procedure))
13	ARH0IRQ0	APIX Remote Handler IRQ0 (Event IRQ ARH0_EVIRQC:EVIRQ, Event Buffer fifo Level ARH0_EVIRQC:LVIRQ, Event Buffer fifo overflow ARH0_EVIRQC:OFLIRQ, AShell fatal error ARH0_CHCTRL0~1:FATIRQ, watchdog timer (TX) ARH0_CHWDGCTL0~1:WDTXIRQ0~3 and (RX) ARH0_CHWDGCTL0~1:WDRXIRQ0~3)
14	ARH0IRQ1	APIX Remote Handler IRQ1 (Transaction Buffer Interrupt ARH0_TBCTRL00~15:TBIRQ)
30	ADC0IRQ	ADC0 Conversion End Interrupt (ADC0_CS1:INT signals end of conversion for current channel (this flag is mirrored in ADC0_CS3:INT))
31	ADC0IRQ2	ADC0 Scan End Interrupt (ADC0_CS3:INT2 is set when the current scan over selected channels has finished)
32	ADC0IRQR	ADC0 Range Comparator Interrupt (ADC0_RCOINT10~32:RCOINT[15:0] are set when corresponding ADC result is outside selected range (check ADC0_RCOOF10~32:RCOOF[15:0] and the selected mode ADC0_RCOIRS10~32:RCOIRS[15:0] for interrupt cause)
33	ADC0IRQP	ADC0 Pulse Detection Interrupt (ADC0_PCZF10~32:CTPZF[15:0] are set when corresponding pulse counter becomes zero)
34	RRCFGIRQERR	Retention RAM Single Bit Error (RRCFG_CSR:CEIF is set when a correctable error occurred during any read access to Retention RAM)

Table 4-1: Interrupt Table (Continued)

Interrupt Line No	Interrupt Name	Interrupt Description
35	SRCFGIRQERR	System RAM Single Bit Error (SRCFG_ERRFLG:SECFLG is set when a correctable error occurred during any read access to SRAM)
36	TCCFGIRQ	Instruction Flash Write Completion Interrupt (TCFCFG_FSTATn:RDYINT is set on the rising edge of TCFCFG_FSTATn:RDY flag) Instruction Flash Hang Interrupt (TCFCFG_FSTATn:HANGINT is set when a hang condition occurs in Instruction Flash) Instruction Flash Single Bit Error (TCFCFG_FSECIR:SECINT is set when a correctable error occurred during any read access to Instruction Flash)
37	EEFCGIRQERR	Data Flash Error Interrupt (EEFCFG_SR:ERRINT is set if the write command sequencer is disabled in ongoing operation or if any write error occurs during ongoing transfer) Data Flash Hang Interrupt (EEFCFG_SR:HANGINT is set when a hang condition occurs in Data Flash)
38	IRQ0IRQERR	IUNIT Vector RAM Single Bit Error (IRQ0_EE1:EEIS is set when a correctable error occurred during any read access to Interrupt Controller RAM)
41	EEFCGIRQ	Data Flash Write Completion Interrupt (EEFCFG_SR:RDYINT is set on the rising edge of EEFCFG_SR:RDY flag) Data Flash Single Bit Error (EEFCFG_SECIR:SECINT is set when a correctable error occurred during any read access to Data Flash)
42	EICU0IRQ	External Interrupt Capture Unit 0 Interrupt (EICU0_CNFR:DATAVALID is set when 256 samples have been taken at the selected external interrupt input pin)
43	HSSPI0IRQRX	HSSPI0 Receive Interrupt (check HSSPI0_RXF:[6:0] for detailed RX interrupt cause)
44	HSSPI0IRQTX	HSSPI0 Transmit Interrupt (check HSSPI0_TXF:[6:0] for detailed TX interrupt cause)
49	SPI0IRQRX	SPI0 Receive Interrupt (check SPI0_RXF:[6:0] for detailed RX interrupt cause)
50	SPI0IRQTX	SPI0 Transmit Interrupt (check SPI0_TXF:[6:0] for detailed TX interrupt cause)
52	SPI1IRQRX	SPI1 Receive Interrupt (check SPI1_RXF:[6:0] for detailed RX interrupt cause)

Table 4-1: Interrupt Table (Continued)

Interrupt Line No	Interrupt Name	Interrupt Description
53	SPI1IRQTX	SPI1 Transmit Interrupt (check SPI1_TXF:[6:0] for detailed TX interrupt cause)
55	SPI2IRQRX	SPI2 Receive Interrupt (check SPI2_RXF:[6:0] for detailed RX interrupt cause)
56	SPI2IRQTX	SSPI2 Transmit Interrupt (check SPI2_TXF:[6:0] for detailed TX interrupt cause)
61	CAN0IRQ	CAN0 Interrupt (this interrupt is called depending on CTRLR0:EIE, CTRLR0:SIE and the corresponding transmit/receive interrupt enable flags in the message objects TXE/RXE)
62	CAN1IRQ	CAN1 Interrupt (this interrupt is called depending on CTRLR1:EIE, CTRLR1:SIE and the corresponding transmit/receive interrupt enable flags in the message objects TXE/RXE)
63	CAN2IRQ	CAN2 Interrupt (this interrupt is called depending on CTRLR2:EIE, CTRLR2:SIE and the corresponding transmit/receive interrupt enable flags in the message objects TXE/RXE)
69	EIC0IRQ0	External Interrupt 0 (EIC0_EIRR:ER0 is set when an interrupt condition is detected at the corresponding input pin)
70	EIC0IRQ1	External Interrupt 1 (EIC0_EIRR:ER1 is set when an interrupt condition is detected at the corresponding input pin)
71	EIC0IRQ2	External Interrupt 2 (EIC0_EIRR:ER2 is set when an interrupt condition is detected at the corresponding input pin)
72	EIC0IRQ3	External Interrupt 3 (EIC0_EIRR:ER3 is set when an interrupt condition is detected at the corresponding input pin)
73	EIC0IRQ4	External Interrupt 4 (EIC0_EIRR:ER4 is set when an interrupt condition is detected at the corresponding input pin)
74	EIC0IRQ5	External Interrupt 5 (EIC0_EIRR:ER5 is set when an interrupt condition is detected at the corresponding input pin)

Interrupt Line No	Interrupt Name	Interrupt Description
158	USART6IRQRX	LIN USART 6 Receive Interrupt (UART6_SSR:RDF (receive data full), USART6_ESR:RXHRI (automatic reception of LIN header completed))
159	USART6IRQTX	LIN USART 6 Transmit Interrupt (UART0_SSR:TDRE (transmission data empty), USART6_ECCR:RBI = 1 and USART6_ECCR:TBI = 1 and USART6_ECCR:BIE = 1 (bus idle interrupt), USART0_ESR:LBSOF (transmitted last bit in synchronous/asynchronous mode), USART0_ESR:TXHRI (automatic transmission of LIN header completed))
160	USART6IRQERR	LIN USART 6 Error Interrupt (USART0_SSR:PE (parity error), USART6_SSR:ORE (overrun error), USART6_SSR:FRE (framing error), USART6_CSCR:CRCCERR (error found in checksum validation), USART0_ESR:SYNFE (sync field detection timeout), USART0_ESR:BUSERR (bus error occurred), USART0_ESR:PEFRD (parity error in received frame ID))
164	DMA0IRQD0	DMA0 Completion Interrupt for channels 0 + 8*n (DMACDIRQ1:DIRQ[24, 16, 8, 0] and DMACDIRQ2:DIRQ[56, 48, 40, 32])
165	DMA0IRQD1	DMA0 Completion Interrupt for channels 1 + 8*n (DMACDIRQ1:DIRQ[25, 17, 9, 1] and DMACDIRQ2:DIRQ[57, 49, 41, 33])
166	DMA0IRQD2	DMA0 Completion Interrupt for channels 2 + 8*n (DMACDIRQ1:DIRQ[26, 18, 10, 2] and DMACDIRQ2:DIRQ[58, 50, 42, 34])
167	DMA0IRQD3	DMA0 Completion Interrupt for channels 3 + 8*n (DMACDIRQ1:DIRQ[27, 19, 11, 3] and DMACDIRQ2:DIRQ[59, 51, 43, 35])
168	DMA0IRQD4	DMA0 Completion Interrupt for channels 4 + 8*n (DMACDIRQ1:DIRQ[28, 20, 12, 4] and DMACDIRQ2:DIRQ[60, 52, 44, 36])
169	DMA0IRQD5	DMA0 Completion Interrupt for channels 5 + 8*n (DMACDIRQ1:DIRQ[29, 21, 13, 5] and DMACDIRQ2:DIRQ[61, 53, 45, 37])
170	DMA0IRQD6	DMA0 Completion Interrupt for channels 6 + 8*n (DMACDIRQ1:DIRQ[30, 22, 14, 6] and DMACDIRQ2:DIRQ[62, 54, 46, 38])
171	DMA0IRQD7	DMA0 Completion Interrupt for channels 7 + 8*n (DMACDIRQ1:DIRQ[31, 23, 15, 7] and DMACDIRQ2:DIRQ[63, 55, 47, 39])

Table 4-1: Interrupt Table (Continued)

Interrupt Line No	Interrupt Name	Interrupt Description
172	DMA0IRQERR	DMA0 Error Interrupt (DMACEDIRQ1:EDIRQ[31:0] and DMACEDIRQ2:EDIRQ[63:32])
173	MSCTIRQ	Main Source Clock Timer Interrupt (SYSC_MAINSCTS-TATR:INTF is set when counter matches or is greater than the corresponding compare register)
174	SSCTIRQ	Sub Source Clock Timer Interrupt (SYSC_SUBSCTS-TATR:INTF is set when counter matches or is greater than the corresponding compare register)
175	RCSCTIRQ	RC Source Clock Timer Interrupt (SYSC_RCSCTSTATR:INTF is set when counter matches or is greater than the corresponding compare register)
176	SRCSCCTIRQ	Slow RC Source Clock Timer Interrupt (SYSC_SRCSCSTS-TATR:INTF is set when counter matches or is greater than the corresponding compare register)
177	CORE0IRQ	CORTEX R4 Performance Monitor Interrupt
178	RLT0IRQ	Reload Timer 0 Interrupt (RLT0_TMCSR:UF is set when reload timer counter underflows)
179	RLT1IRQ	Reload Timer 1 Interrupt (RLT1_TMCSR:UF is set when reload timer counter underflows)
180	RLT2IRQ	Reload Timer 2 Interrupt (RLT2_TMCSR:UF is set when reload timer counter underflows)
181	RLT3IRQ	Reload Timer 3 Interrupt (RLT3_TMCSR:UF is set when reload timer counter underflows)
182	RLT4IRQ	Reload Timer 4 Interrupt (RLT4_TMCSR:UF is set when reload timer counter underflows)
183	RLT5IRQ	Reload Timer 5 Interrupt (RLT5_TMCSR:UF is set when reload timer counter underflows)
184	RLT6IRQ	Reload Timer 6 Interrupt (RLT6_TMCSR:UF is set when reload timer counter underflows)
185	RLT7IRQ	Reload Timer 7 Interrupt (RLT7_TMCSR:UF is set when reload timer counter underflows)

Table 4-1: Interrupt Table (Continued)

Interrupt Line No	Interrupt Name	Interrupt Description
186	RLT8IRQ	Reload Timer 8 Interrupt (RLT8_TMCSR:UF is set when reload timer counter underflows)
187	RLT9IRQ	Reload Timer 9 Interrupt (RLT9_TMCSR:UF is set when reload timer counter underflows)
194	UDC0IRQ0	Up/Down Counter 0 channel 0 Interrupt (UDN0_CS0:OVFF (overflow), UDF (underflow), CMPF (compare match))
195	UDC0IRQ1	Up/Down Counter 0 channel 1 Interrupt (UDN0_CS1:OVFF (overflow), UDF (underflow), CMPF (compare match))
198	I2S0IRQ	I2S0 Interrupt (check I2S0_STATUS:[31:24], [19], [17:16] for detailed interrupt cause)
199	I2S1IRQ	I2S1 Interrupt (check I2S1_STATUS:[31:24], [19], [17:16] for detailed interrupt cause)
202	I2C0IRQ	I2C0 Interrupt (I2C0_IBCSR_INT (masked by I2C0_IBCSR_INTE) set after end of 1 byte data transfer or reception including acknowledge bit (bus master, addressed as slave, GCA received, Arbitration lost), I2C0_IBCSR_BER (masked by I2C0_IBCSR_BEIE) indicates bus error (Start- or Stop-Condition detected at wrong places))
203	I2C0IRQERR	I2C0 Error Interrupt (I2C0_IBCSR_BER (masked by I2C0_IEIER_BEREIE) indicates bus error (Start- or Stop-Condition detected at wrong places), I2C0_IBCSR_AL (masked by I2C0_IEIER_ALEIE) indicates arbitration lost)
206	CRC0IRQ	CRC0 Interrupt (CRC0_CFG:CIRQ set after checksum is calculated and available in register)
208	PPG0IRQ	Programmable Pulse Generator 0 Interrupt (PPG0_PCN:IRQF set depending on PPG0_PCN:IRS[2:0], PPG0_EPCN1:TRIG set when PWM output generation is started, PPG0_EPCN2:[7:0] see detailed description in docu) Programmable Pulse Generator 0 Interrupt
209	PPG1IRQ	Programmable Pulse Generator 1 Interrupt (PPG1_PCN:IRQF set depending on PPG1_PCN:IRS[2:0], PPG1_EPCN1:TRIG set when PWM output generation is started, PPG1_EPCN2:[7:0] see detailed description in docu)

Table 4-1: Interrupt Table (Continued)

Interrupt Line No	Interrupt Name	Interrupt Description
210	PPG2IRQ	Programmable Pulse Generator 2 Interrupt (PPG2_PCN:IRQF set depending on PPG2_PCN:IRS[2:0], PP2_EPCN1:TRIG set when PWM output generation is started, PPG2_EPCN2:[7:0] see detailed description in docu)
211	PPG3IRQ	Programmable Pulse Generator 3 Interrupt (PPG3_PCN:IRQF set depending on PPG3_PCN:IRS[2:0], PPG0_EPCN1:TRIG set when PWM output generation is started, PPG3_EPCN2:[7:0] see detailed description in docu)
212	PPG4IRQ	Programmable Pulse Generator 4 Interrupt (PPG4_PCN:IRQF set depending on PPG4_PCN:IRS[2:0], PPG4_EPCN1:TRIG set when PWM output generation is started, PPG4_EPCN2:[7:0] see detailed description in docu)
213	PPG5IRQ	Programmable Pulse Generator 5 Interrupt (PPG5_PCN:IRQF set depending on PPG5_PCN:IRS[2:0], PPG5_EPCN1:TRIG set when PWM output generation is started, PPG5_EPCN2:[7:0] see detailed description in docu)
214	PPG6IRQ	Programmable Pulse Generator 6 Interrupt (PPG6_PCN:IRQF set depending on PPG6_PCN:IRS[2:0], PPG6_EPCN1:TRIG set when PWM output generation is started, PPG6_EPCN2:[7:0] see detailed description in docu)
215	PPG7IRQ	Programmable Pulse Generator 7 Interrupt (PPG7_PCN:IRQF set depending on PPG7_PCN:IRS[2:0], PPG7_EPCN1:TRIG set when PWM output generation is started, PPG7_EPCN2:[7:0] see detailed description in docu)
216	PPG8IRQ	Programmable Pulse Generator 8 Interrupt (PPG8_PCN:IRQF set depending on PPG8_PCN:IRS[2:0], PPG8_EPCN1:TRIG set when PWM output generation is started, PPG8_EPCN2:[7:0] see detailed description in docu)
217	PPG9IRQ	Programmable Pulse Generator 9 Interrupt (PPG9_PCN:IRQF set depending on PPG9_PCN:IRS[2:0], PPG9_EPCN1:TRIG set when PWM output generation is started, PPG9_EPCN2:[7:0] see detailed description in docu)
218	PPG10IRQ	Programmable Pulse Generator 10 Interrupt (PPG10_PCN:IRQF set depending on PPG10_PCN:IRS[2:0], PPG10_EPCN1:TRIG set when PWM output generation is started, PPG10_EPCN2:[7:0] see detailed description in docu)
219	PPG11IRQ	Programmable Pulse Generator 11 Interrupt (PPG11_PCN:IRQF set depending on PPG11_PCN:IRS[2:0], PPG11_EPCN1:TRIG set when PWM output generation is started, PPG11_EPCN2:[7:0] see detailed description in docu)

Interrupt Line No	Interrupt Name	Interrupt Description
236	PPG68IRQ	Programmable Pulse Generator 68 Interrupt (PPG68_PCN:IRQF set depending on PPG68_PCN:IRS[2:0], PPG68_EPCN1:TRIG set when PWM output generation is started, PPG68_EPCN2:[7:0] see detailed description in docu)
237	PPG69IRQ	Programmable Pulse Generator 69 Interrupt (PPG69_PCN:IRQF set depending on PPG69_PCN:IRS[2:0], PPG69_EPCN1:TRIG set when PWM output generation is started, PPG69_EPCN2:[7:0] see detailed description in docu)
238	PPG70IRQ	Programmable Pulse Generator 70 Interrupt (PPG70_PCN:IRQF set depending on PPG70_PCN:IRS[2:0], PPG70_EPCN1:TRIG set when PWM output generation is started, PPG70_EPCN2:[7:0] see detailed description in docu)
239	PPG71IRQ	Programmable Pulse Generator 71 Interrupt (PPG71_PCN:IRQF set depending on PPG71_PCN:IRS[2:0], PPG71_EPCN1:TRIG set when PWM output generation is started, PPG71_EPCN2:[7:0] see detailed description in docu)

4.2 NMI

Table 4-2: List of NMI

NMI Number	Source	Description
0	EIC0NMI	External Pin NMI (EIC0_NMIR:NMIINT)
1	SYSCNMILVD	Low Voltage Detect NMI (check SYSC_SYSERRR:LVD12IF, SYSC_SYSERRR:LVD33IF, SYSC_SYSERRR:LVD50IF for detailed NMI cause)
2	SYSCNMIERR	System Controller Error NMI (check SYSC_SYSERRR:RUNERRIF, SYSC_SYSERRR:RUNWKERRIF, SYSC_SYSERRR:PSSERRIF, SYSC_SYSERRR:TRGERRIF, SYSC_SYSERRR:RUNTRGEIF, SYSC_SYSERRR:MOMISSIF, SYSC_SYSERRR:SOMISSIF, SYSC_SYSERRR:MPMISSIF, SYSC_SYSERRR:SPMISSIF, SYSC_SYSERRR:GPMISSIF, SYSC_SYSERRR:PSSENEIF for detailed NMI cause)
3	WDGNMI	Watchdog NMI (WDG_INT:NMI_FLAG is set on Watchdog error condition if WDG_INT:NMI_EN is '1')
4	TPU0NMI	Timing Protection Unit NMI (check TPU0TIR:IR[7:0] bits for detailed NMI cause) Note: The Timing Protection Unit NMI is maskable within the TPU but non-maskable on system level.
5	MPUXD-MA0NMI	MPU DMA0 Access Violation NMI (MPUXDMA0_CTRL0:NMI is set when a memory protection violation by DMA0 is detected)
9	IRQ0NMIERR	IRQ Double Error NMI (IRQ0_EEI:EENS bit is set when a double bit error is detected in the IRQ0 Interrupt Vector RAM)
11	BECU0NMI	BECU0 Access Violation NMI (BECU0_CTRL:NMI bit is set when a bus error is detected on the Peripheral Group 0 bus)
12	BECU1NMI	BECU1 Access Violation NMI (BECU1_CTRL:NMI bit is set when a bus error is detected on the Peripheral Group 1 bus)
13	BECU3NMI	BECU3 Access Violation NMI (BECU3_CTRL:NMI bit is set when a bus error is detected on the Peripheral Group 3 bus)

4.3 DMA Overview

Table 4-3: Modules with DMA

DMA Client (Interface)	DMA Client (Interface) Name	DMA Client (Interface) Description
0	EXTDMA0	External DMA Request 0 (external pin DMA0_DREQ0)
1	EXTDMA1	External DMA Request 1 (external pin DMA0_DREQ0)
8	EIC0DMA0	External Interrupt 0 DMA Request (EIC0_DRFR:DRF0)
9	EIC0DMA1	External Interrupt 1 DMA Request (EIC0_DRFR:DRF1)
10	EIC0DMA2	External Interrupt 2 DMA Request (EIC0_DRFR:DRF2)

Note:

In general, a PPU channel controls the access in user mode to the corresponding peripheral.

However, there are a few exceptions:

- PPCPRIV controls the access to PPC in privileged mode
- PPCUSER controls the access to PPC in user mode
- MSCT, SSCT, RCSCT and SRCSCT control the access to the source clock timers within the System Controller, i.e. the registers SYSC_MSCT*, SYSC_SSCT*, SYSC_RCSCT* and SYSC_SRCSCT, after the corresponding source clock stabilization time has elapsed

- WDG controls the write access in user mode to the Watchdog trigger registers, so WDG has no read attribute
- Read attribute for DBG0 is always enabled. Even privilege mode access for DBG0 needs PPU to be enabled.

Note:

- SYSC_SPCCFGR:FASTON register bit is reserved and should be always written as '0', since this device does not support "Fast Power domain control" feature.
- SCCFG_STAT1:EEFCEEN and SCCFG_STAT1:TCFCEEN register bits are read-1 (write has no impact and read always returns '1') in this device.
- SCCFG_STAT1:FPPEN and SCCFG_STAT1:SCMEN register bits are read-0 (write has no impact and read always returns '0') in this device.

6 Electrical characteristics

6.1 Absolute Maximum Ratings

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

NOTES:

- *1: AV_{DD5} and V_{DP5} must be set to the same voltage. It is required that AV_{DD5} does not exceed V_{DP5} and that the voltage at the analog inputs does not exceed AV_{DD5} neither when the power is switched on.
- *2: V_I and V_O should not exceed V_{DP5} + 0.3 V. V_I should also not exceed the specified ratings. However if the maximum current to/from a input is limited by some means with external components, the I_{CLAMP} rating supersedes the V_I rating. Input/output voltages of standard ports depend on V_{DP5}.
- *3:
- Applicable to all general purpose I/O pins (Pi_{jj})
 - Use within recommended operating conditions.
 - Use at DC voltage (current).
 - +B signals are input signals that exceed the V_{DP5} / V_{DP3} / DV_{CC} voltage.
 - The +B signals should always be applied a limiting resistance placed between the +B signal and the microcontroller.
 - The value of the limiting resistance should be set so that when the +B signal is applied the input current to the microcontroller pin does not exceed rated values, either instantaneously or for prolonged periods.
 - Note that when the microcontroller drive current is low, such as in the power saving modes, the +B input potential may pass through the protective diode and increase the potential at the V_{DP5} pin, and this may affect other devices.
 - Note that if a +B signal is input when the microcontroller power supply is off (not fixed at 0 V), the power supply is provided from the pins, so that incomplete operation may result.
 - Note that if the +B input is applied during power-on, the power supply is provided from the pins and the resulting supply voltage may not be sufficient to operate the Power reset (except devices with persistent low voltage reset in internal vector mode).
 - Sample recommended circuits:

- *4: DV_{CC}, AV_{DD5} and V_{DP5} must be set to the same voltage during zero point detection (ZPD) on any of the SMC ports. If zero point detection is not required on any of the SMC ports, then DV_{CC} can have any value with-in absolute rating, provided switches are disabled by RICFG0_ADC0ZPDEN:ZPDEN register. Note, for ZPD, conversion time will be more and accuracy of measurement will be low.

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

Notes:

AC characteristics in CLK synchronized mode.

C_L is the load capacity value of pins when testing.

Depending on the used machine clock frequency, the maximum possible baud rate can be limited by some parameters.

$t_{CLK_PERIO_PD2}$ is the cycle time of the clock (CLK_PERIO_PD2), Unit: ns

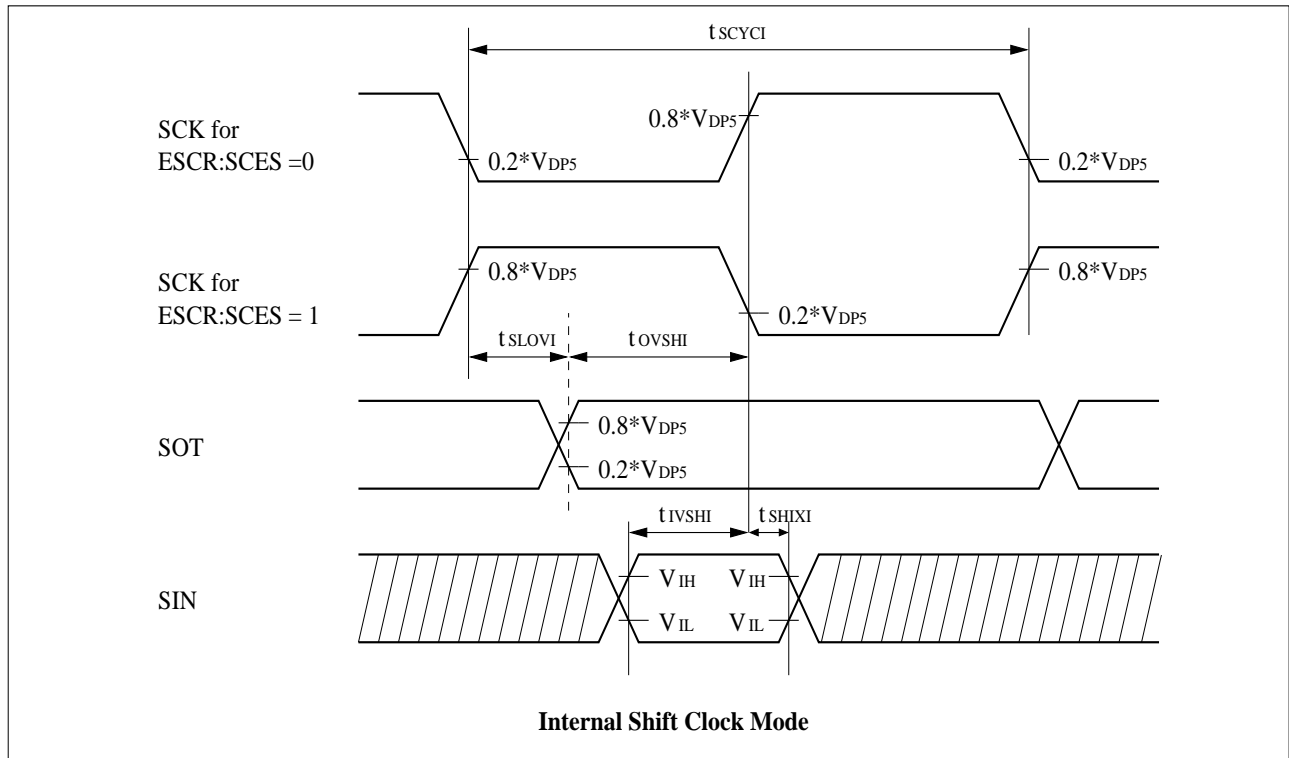

*1: Parameter N depends on t_{SCYCI} and can be calculated as follows:

- if $t_{SCYCI} = 2 * k * t_{CLK_PERIO_PD2}$, then $N = k$, where k is an integer > 2
- if $t_{SCYCI} = (2 * k + 1) * t_{CLK_PERIO_PD2}$, then $N = k + 1$, where k is an integer > 1

Examples:

t_{SCYCI}	N
$4 * t_{CLK_PERIO_PD2}$	2
$5 * t_{CLK_PERIO_PD2}, 6 * t_{CLK_PERIO_PD2}$	3
$7 * t_{CLK_PERIO_PD2}, 8 * t_{CLK_PERIO_PD2}$	4

6.4.9 SPI timing

($T_A = -40^{\circ}\text{C}$ to 105°C , $V_{DD} = V_{DDA} = 1.1\text{V}$ to 1.3V , $V_{DP3} = V_{DEA} = 3.0\text{V}$ to 3.6V , $V_{DP5} = AV_{DD5} = V_{DE5} = 3.0\text{V}$ to 5.5V , $DV_{CC} = 3.0\text{V}$ to 5.5V , $V_{SS} = AV_{SS5} = DV_{SS} = 0\text{V}$)

For each SPI module, several combinations of I/O pins can be chosen for each SPI signal. The timing depends on the actual combination and is given below as separate values for each possible type of I/O-cell. When I/O/cells of different types are mixed, the worst case table, called "OVERALL SPI Interface timing" must be used.

In Master Mode, using the clock retiming function improves the setup and hold times for input data.

The usable maximum clock frequency depends on the transmission mode (Master to Slave / Slave to Master, using clock-retiming or not). An example for calculation is given below each table.

Table 6-14: OVERALL SPI Interface timing

Parameter	Symbol	Master Mode, non-retimed clock		Master Mode, retimed clock		Slave Mode		Unit
		Min	Max	Min	Max	Min	Max	
Input setup time (SPIn_DATAi)	$T_{IS,DATA}$	23.9	-	8.0	-	7.9	-	ns
Input hold time (SPIn_DATAi)	$T_{IH,DATA}$	-4.3 *1	-	5.4	-	5.3	-	ns
Output delay time (SPIn_DATAo)	$T_{OD,DATA}$	-	8.9	-	8.9	-	26.9	ns
Output hold time (SPIn_DATAo)	$T_{OH,DATA}$	-5.7 *1	-	-5.7 *1	-	4.0	-	ns
Input setup time (SPIn_SSELi)	$T_{IS,SSEL}$	-	-	-	-	8.4	-	ns
Input hold time (SPIn_SSELi)	$T_{IH,SSEL}$	-	-	-	-	4.9	-	ns
Output delay time (SPIn_SSELo)	$T_{OD,SSEL}$	-	8.0	-	8.0	-	-	ns
Output hold time (SPIn_SSELo)	$T_{OH,SSEL}$	-5.7 *1	-	-5.7 *1	-	-	-	ns

Example for calculation of max. frequencies for communication of Master (retimed mode) and Slave:

Transmission	Half Period Time	Max. Frequency	Unit
From Master to Slave	$T/2 = T_{OD,DATA} (\text{Master}) + T_{IS,DATA} (\text{Slave})$	29.7	MHz
From Slave to Master	$T/2 = T_{OD,DATA} (\text{Slave}) + T_{IS,DATA} (\text{Master})$	14.3	MHz

Note: *1 : A negative hold time implies that the clock edge output is delayed with respect to data output. In any case, an external device that will receive data, must use a sampling point that is outside the time interval given by Output hold time and Output delay time.

Minimum Sampling Time

The minimum sampling time can be calculated from the following formula:

For pins ADC0_AN0..25:

$$T_{\text{samp}} = 7.63 \times [R_{\text{ext}} \times (C_{\text{ext}} + C_{\text{IN}}) + (R_{\text{ext}} + R_{\text{ADC}}) \times C_{\text{ADC}}]$$

For Pins ADC0_AN26..31:

$$T_{\text{samp}} = 7.63 \times [R_{\text{ext}} \times (C_{\text{ext}} + C_{\text{IN}}) + (R_{\text{ext}} + R_{\text{ADC1}}) \times C_{\text{ADC1}} + (R_{\text{ext}} + R_{\text{ADC1}} + R_{\text{ADC}}) \times C_{\text{ADC}}]$$

Please see the Hardware Manual for an explanation and the reference model for above formulas. The following values are reference values for calculation.

Definition of A/D Converter Terms

Resolution: Analog variation that is recognized by an A/D converter.

Total error: Difference between the actual value and the ideal value. The total error includes zero transition error, full-scale transition error and nonlinearity error.

Nonlinearity error: Deviation between a line across zero-transition line (00 0000 0000 <--> 00 0000 0001) and full-scale transition line (11 1111 1110 <--> 11 1111 1111) and actual conversion characteristics.

Differential linearity error: Deviation of input voltage, which is required for changing output code by 1 LSB, from an ideal value.

Zero reading voltage: Input voltage which results in the minimum conversion value.

Full scale reading voltage: Input voltage which results in the maximum conversion value.

$$\text{Total error of digital output "N"} = \frac{V_{NT} - \{1 \text{ LSB} \times (N-1) + 0.5 \text{ LSB}\}}{1 \text{ LSB}} \text{ [LSB]}$$

$$1 \text{ LSB} = (\text{Ideal value}) \frac{AVRH}{1024} \text{ [V]}$$

N : A/D converter digital output value

V_{OT} (Ideal value) = $0 + 0.5 \text{ LSB}$ [V]

V_{FST} (Ideal value) = $AVRH - 1.5 \text{ LB}$ [V]

V_{NT} : A voltage at which digital output transition from (N-1) to N.

*4: See the Hardware Manual for an explanation about Flash Timing Limit Exceeded Flags. The time during Sector Erase Suspend (period from Suspend Command Write Cycle to Resume Command Write Cycle) is not included.

6.7 RC Oscillator Frequency

This chapter provides reference values for the RC Configuration Register (SYSC_RCCFGR) settings. The corresponding oscillator is commonly referred to as the “12 MHz RC Oscillator”, because its typical frequency at the central setting is about 12 MHz, with the SYSC_RCCFGR:SFREQ bit set to “1”.

When the SYSC_RCCFGR:SFREQ bit is set to “0”, the central setting corresponds to about 8 MHz.

The default value of SYSC_RCCFGR:SFREQ is “1” and the default value of SYSC_RCCFGR:TRM[7:0] is “0xFF”, so the default frequency setting is 16.9 MHz (typical value).

Figure 6-14: RC Oscillator frequency at SYSC_RCCFGR:SFREQ = 0

Note: The provided function values are not guaranteed and can serve for reference, only. Guaranteed values are listed in Table 6-5 on page 356.

7 Procedures

7.1 Boundary scan

Boundary scan is supported using standard IEEE 1149.1 JTAG interface. A 5-pin JTAG connection is available on QFP-176 (production variant), as well as QFP-296 (bond-out variant). Instruction register supported is 6-bits wide, and the standard instructions listed in Table 7-1 are supported. Any other value of instruction register is reserved, and should not be entered. Entering reserved values can result in indeterminate operation.

Boundary scan mode may be entered by setting pins MODE = "1" and MD[0] = "0".

Table 7-1: Supported Instructions

Instruction Code (in binary)	Instruction	Accessible Data Register	Remarks

Note: When Bit[10] = "0", all input buffers are disabled in Boundary Scan mode. Then, input of data via external pins to the BSR (Boundary Scan Register) is impossible. Therefore, the minimum setting to allow input to the BSR is 0x0400.

Procedure for Configuration for Port Input

1. MODE clipped to '1' and MD[0] clipped to '0'.
2. release JTAG_Nrst and RSTX.
3. JTAG-Instruction IO_CNTRL (010001)
4. set IO_CNTRL-reg 10th bit: (e.g. 0000010000000000)
5. JTAG-Instruction SAMPLE. -> Port Input

The serial chain starts with the I/O closest to JTAG_TDI pin, and ends with the I/O closest to the JTAG_TDO pin. Details may be obtained from BSDL files released per package.

7.2 Flash Parallel Programming

Flash Parallel Programming (FPP) mode is supported to allow for quick programming/erase of embedded flashes. In this mode program or erase of flash is done using a flash memory programmer directly via external pins. Flash programming is done either in 8-bit or 16-bit mode through the command sequence. Refer Section 4 of Tightly Coupled Flash Chapter of HWM for details of Flash program/erase command sequence. Flash addressing in this mode is direct physical addressing, with higher order bits used for flash macro selection.

In MB9DF126 device, there are 2 flash macros of 1MB+64KB size each, and 1 flash macro of 64KB. Details about flash macro sectoring are shown in Table 7-4

Table 7-4: Flash sector information

Flash Macro	Macro size	Small Sectors (8KB/sector)	Large sectors (64KB/sector)
TCFLASH macro 0	1MB + 64KB	8	16
TCFLASH macro 1	1MB + 64KB	8	16
EEFLASH macro	64KB	8	Not Available

Details about mapping of flash pins to external pins are presented in Table 7-5.

7.2.1 Memory Map

This flash memory consists of 16 sectors of 64k byte (large sector) and 8 sectors of 8k byte (small sector).

A large sector is composed of 16k word, and a small sector is composed of 2k word. 1word data width is 39bit (regular bit: 32bit + ECC parity bit: 7bit) for both large sector and small sector.

7.2.1.1 Address Space & Memory Cell Select Address Assignment

The select address assignment is listed below. The assignment in the large sector and that in the small sector differ.

When the small sector (FA[20]=0) is selected, no matter what the values (1/0) of FA[19:16] are, the memory cell to be used is determined according to the values of FA[15:0].

■ Large Sector (0x100000 ~ 0x1FFFFFF)

8bit program mode (BYTEX=0) : Ignore none of FA[20:0] and input 8bit selected in FA[20:0].

16bit program mode (BYTEX=1) : Ignore FA[0] and input 16bit.

- FPP mode can only output 8 or 16 bit.
- RD64 should always be kept 0.
- BYTEX=0: DQ[7:0] is used
- BYTEX=1: DQ[15:0] is used

16bit program mode (BYTEX=1) : Ignore FA[0] and input 16bit.

- FPP mode can only output 8 or 16 bit.

- RD64 should always be kept 0.
- BYTEX=0: DQ[7:0] is used
- BYTEX=1: DQ[15:0] is used

7.2.1.2 LIMITATION ON MB9DF126 DEVICE

MB9DF126 device has the following limitation:

Reading works only, when both other FLASHs are programmed with all-0 (output data of 3 FLASHs is logically ORed). Therefore, reading of FLASH is not supported.

- Programming/erasing FLASH can be done by checking RDY, verifying of read data is not possible
- It is recommended to choose a JTAG programmer

7.2.1.3 Input Data Table

In 8bit program mode, the data of the different input pins based on the FA[0] values is programmed as shown in the Table 7-9:

When ECCA=1 is input at the program data input, the data is written to ECC parity bit as well as Regular bit. When ECCA=0 is input at the program data input, the data is written only to Regular bit. In this case, EDIN[6:0] input value is "don't care," and regardless of the value, no value is written to ECC parity bit. In the case of erase operation, regardless of input values to ECCA, both Regular bit and ECC parity bit are erased together.

Table 7-9: Correspondence Table of Data Input and Memory Cell Bit in Program Bit Modes

Bit Mode	BYTEX	Write Cycle	Select Address				Data Input pins					
			FA[#]	FA[1]	FA[0]	ECCA	DIN[15:8]	DIN[7:0]	EDIN[6:0]			
16bit	1	Command data input	1/0	1/0	1/0	1/0	any	command data 7-0	any			
		Program data input	1	1	1	1/0	1	Odd. Sector Regular bit 31-24	Odd. Sector Regular bit 23-16	Odd. Sector Parity bit 6-0		
					0	0	Odd. Sector Regular bit 15-8	Odd. Sector Regular bit 7-0	any			
			0	1	1	1/0	1	Even Sector Regular bit 31-24	Even Sector Regular bit 23-16	Even Sector Parity bit 6-0		
					0	0	Even Sector Regular bit 15-8	Even Sector Regular bit 7-0	any			
		8bit	0	Command data input	1/0	1/0	1/0	1/0	any	command data 7-0	any	
				Program data input	1	1	1	1	1	Odd. Sector Regular bit 31-24	any	Odd. Sector Parity bit 6-0
							0	0	any	Odd. Sector Regular bit 23-16	Odd. Sector Parity bit 6-0	
0	1					1	1	1	Odd. Sector Regular bit 15-8	any	Odd. Sector Parity bit 6-0	
						0	0	any	Odd. Sector Regular bit 7-0	Odd. Sector Parity bit 6-0		
0	1				1	1	1	1	Even Sector Regular bit 31-24	any	Even Sector Parity bit 6-0	
						0	0	any	Even Sector Regular bit 23-16	Even Sector Parity bit 6-0		
	0				1	1	1	1	1	Even Sector Regular bit 15-8	any	Even Sector Parity bit 6-0
		0	0				any	Even Sector Regular bit 7-0	Even Sector Parity bit 6-0			

- "Any" a value of either 1 or 0.
- FA[#] indicates the lowest bit of sector-selected address, i.e. FA[16] when the large sector is selected (FA[n]=1), and FA[13] when the small sector is selected (FA[n]=0). When programming, in both 8bit mode and 16bit mode, program/erase operation is executed per one sector specified by the selected addresses.
- Program Data Input means the 4th write cycle of a program command in the normal operation state and the 2nd write cycle of a program command in the Unlock-bypass state.
- Command Data Input means the write cycles in the write command sequence other than those mentioned above in which program data is input.

7.2.2 Flash macro selection and address mapping in FPP

Individual flash macros can be accessed using the address decoding scheme as mentioned in Table 7-10.

Table 7-10: Flash macro selection

DFSEL	FA[21]	Flash Macro selection
0	0	TCFLASH macro 0
0	1	TCFLASH macro 1
1	X	EEFLASH macro

However, device level memory map differs from actual physical address to flash macro. Hence, it is expected that the flash parallel programmer must translate CPU mode addressing to actual physical address to flash. Hence, CPU execution code must be located at physical addresses that are mapped to the CPU mode addresses.

Translation of CPU mode address to actual physical address differs based on whether small or large sectors are accessed. Address translation for small sectors of TCFLASH macro 0 and 1 is as shown in Table 7-11.

Table 7-11: TCFlash small sectors address translation

Note:

Small sectors are interleaved (even and odd sectors). Even numbered sectors provide lower 4 byte and odd numbered sectors provide upper 4 byte of a 64 bit FLASH line.

Address translation for large sectors of TCFlash is shown in Table 7-12.

Note

- Large sectors of TCFLASH are 4-times interleaved for best read performance (see also HW/Manual fig. 9.3-2 TCFLASH sector/address mapping - CPU mode).
- Large sectors are interleaved (even and odd numbered sectors). Even numbered sectors provide lower 4 byte and odd numbered sectors provide upper 4 byte of a 64 bit FLASH line.
- Address space is interleaved between TCFLASH0 and TCFLASH1. TCFLASH0 keeps lower 8 byte and TCFLASH1 keeps upper 8 byte of a 128 bit FLASH line (2 FLASHs are read in parallel).

EEFlash macro small sectors address translation is as shown in Table 7-13.

7.2.3 Flash Power On Sequence

Prior to entering flash parallel programming mode, the sequence mentioned below must be followed:

1. Apply following constant pin setting: MODE = 1 and MD[2:0] = 111. The pins for MD[2:0] have pull-up, thus can be left open.
2. Assert RSTX = 0 and JTAG_nTRST = 0. The pin JTAG_nTRST has pull-down, so it will be kept in reset by the device if it is left open. Asserting FRSTX = 0 and FRSTRX = 0 is optional. This is done internally at device startup.
3. Ramp up the power supply (please refer to device specific datasheet for power supply sequence) and wait till all power supplies (VDP5, VDP3 & VDD) are stable
4. Wait for at least 500ns after all power supplies are stable.
5. De-assert RSTX= 1, also deassert FRSTX = 1 and FRSTRX = 1 if those were asserted before.
6. Wait until Flash Parallel Programming mode is entered by the bootROM program (boot time). Wait time should be ≥ 2.5 ms after RSTX release. Note that the wait time is necessary because RDY pin is High-Z before FPP mode is entered. Looking at RDY (which has pull-up) alone would cause mis-interpretation before that time is elapsed.
7. Flash access is possible after RDY pin goes to "1" . Clock supply is needed for monitoring RDY.

RDY pin is pseudo open drain and thus needs a pull-up resistor. That makes it possible to program multiple devices at once by using wired-AND of the RDY outputs, to detect when slowest device becomes ready.

Failure to follow the above sequence can result in indeterminate behavior. Once the above sequence is completed, flash parallel programming mode may be entered.

Flash parallel programming mode standard usage:

Entering FPP by releasing RSTX while keeping

- MODE = '1'
- MD[1] = '1' , MD[0] = '1'
- SMD[2] = '1' , SMD[1] = '1' , SMD[0] = '1'

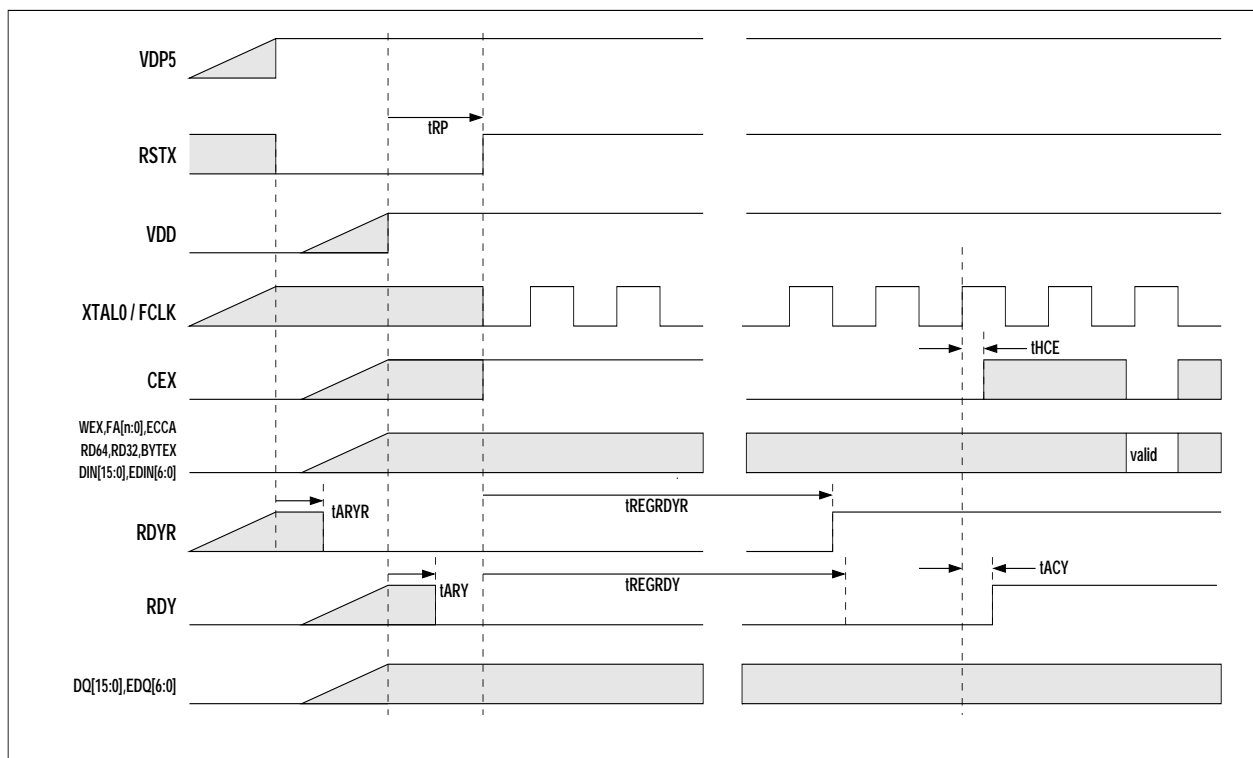

Furthermore, Flash parallel programming mode may be entered using 2 options:

1. Setting MCFG_DTAR:FPPREQ
2. Setting MCFG_TSR:MD= 'XXX111', and MCFG_TSR:SMD= '11111'

Once flash parallel mode is requested, the bit SYSC_MCR:FPPEN is set, which enables entry to FPP mode. However, it must be noted that FPP access must also be enabled in Security Description Record (SDR) (see HWM).

The external programmer must also take care to program ECC bits for flash data contents. This also applies to flash erase, where bit flipping (XOR with 0x73) is to be performed to handle ECC checking for erased flash.

Recommendation: FRSTX = FRSTRX = '1'

7.3 Debug and Trace

A standard 5-pin JTAG interface is supported for debug and trace. Conventional debug (core halted, and invasive) as well as trace debug (core not halted and non-invasive) are supported. The procedures for debug and trace are based on ARM Coresight technology. The features for debug are:

- Secure mode entry for debugger
- Up to 8 breakpoints, or 8 watchpoints

Tracing support is provided on both packages as shown below:

- QFP-176: 4-bit, 8-bit trace data shared with resources.
- QFP-296: 4-bit, 8-bit, 16-bit, and 32-bit trace data

Trace port to pin mapping in QFP-176 and QFP-296 packages is shown in Table 7-15.

Table 7-15: Trace port to external pin mapping

External Pin Number (QFP-176)	External Pin Number (QFP-296)	External Pin Name	Trace Port

-	144	TRACE[13]	TRACE[13]
-	147	TRACE[14]	TRACE[14]
-	148	TRACE[15]	TRACE[15]

Package QFP-176 has no dedicated trace pins. Please see the Port Pin Multiplexing table in Chapter 3.2.1 for relevant pins and the corresponding settings for their activation.

In general, additional information regarding debug and trace methodology can be obtained from Coresight TRM provided by ARM Limited. However, an additional characteristic is the support of security feature to prevent unau-

thorized access through the debug port. At the time of initiating the debugger access, it depends on the security configuration of the device, whether it is necessary to transmit a security key. The security key can only be transmitted once after reset. If a wrong key is entered, further accesses are disabled, and the only method to regain access is through application of external reset.

In the device, trace support is provided for the following components/busses:

1. Embedded Trace Macro (ETM) and Instrumentation Trace Macro (ITM) for processor core
2. 2 independent AHB bus trace macro (HTM) for up to 8 busses. Refer Table 7-16 for details

Further, Cross Trigger Interface (CTI) macros are included to support cross triggering among all the above macros.

Table 7-16: HTM trace sources

Bus	Width (bits)	Source ID
DMA master	64	1
PERI4 master	32	2
MEMORY_CONFIG slave	64	3
MCU_CONFIG slave	32	4
PERI5 slave	32	5
PERI3 slave	64	6
PERI4 slave	32	7
HSSPI slave	32	8
EBI slave	32	9

Power domain on/off status information can be obtained through debug port by accessing register on memory mapped address 0xB0509400. This provides an easy method to obtain information on current state of power domains, without the need to access device level internal registers. Refer Table 7-17 for details.

Table 7-17: Power domain status information for debugger

Bit Number	Function
31:3	Reserved
2	PD4 on/off status '0' : Power domain is off '1' : Power domain is on
1	PD3 on/off status '0' : Power domain is off '1' : Power domain is on
0	PD2 on/off status '0' : Power domain is off '1' : Power domain is on

In the QFP-296 pin package, trace data width settings are configurable on the non-shared pins through register at memory mapped address 0xB0509404. This is highlighted in Table 7-18.

Table 7-18: Trace width setting on QFP-296 package

5	'1' : Trace control (CTL) is driven on pin
4	'1' : bits 31 to 16 of trace data are driven on pins
3	'1' : bits 15 to 8 of trace data are driven on pins
2	'1' : bits 7 to 4 of trace data are driven on pins
1	'1' : bits 3 to 2 of trace data are driven on pins
0	'1' : bits 1 to 0 of trace data are driven on pins

8 Handling Devices

8.1 Preventing Latch-up

Latch-up may occur in a CMOS IC if a voltage higher than (V_{DD} , V_{DP3} or V_{DP5}) or less than (V_{SS}) is applied to an input or output pin or if a voltage exceeding the rating is applied between the power supply pins and ground pins. If latch-up occurs, the power supply current increases rapidly, sometimes resulting in thermal breakdown of the device. Therefore, be very careful not to apply voltages in excess of the absolute maximum ratings.

8.2 Handling of unused input pins

If unused input pins are left open, abnormal operation may result. Any unused input pins should be connected to pull-up or pull-down resistor ($2K\Omega$ to $10K\Omega$) or enable internal pullup or pulldown resistors (PUE/PDE) before the input enable (PIE) is activated by software. The pins of circuit type MODE can be connected to V_{SS} or V_{DP5} directly.

8.3 Power supply pins

In FCR4 series, devices including multiple power supply pins and ground pins are designed as follows: pins necessary to be at the same potential are interconnected internally to prevent malfunctions such as latch-up. All of the power supply pins and ground pins must be externally connected to the power supply and ground respectively in order to reduce unnecessary radiation, to prevent strobe signal malfunctions due to the ground level rising and to follow the total output current ratings. Furthermore, the power supply pins and ground pins of the FCR4 series must be connected to the current supply source via a low impedance.

It is also recommended to connect a ceramic capacitor of approximately $0.1 \mu F$ as a bypass capacitor between power supply pin and ground pin near this device.

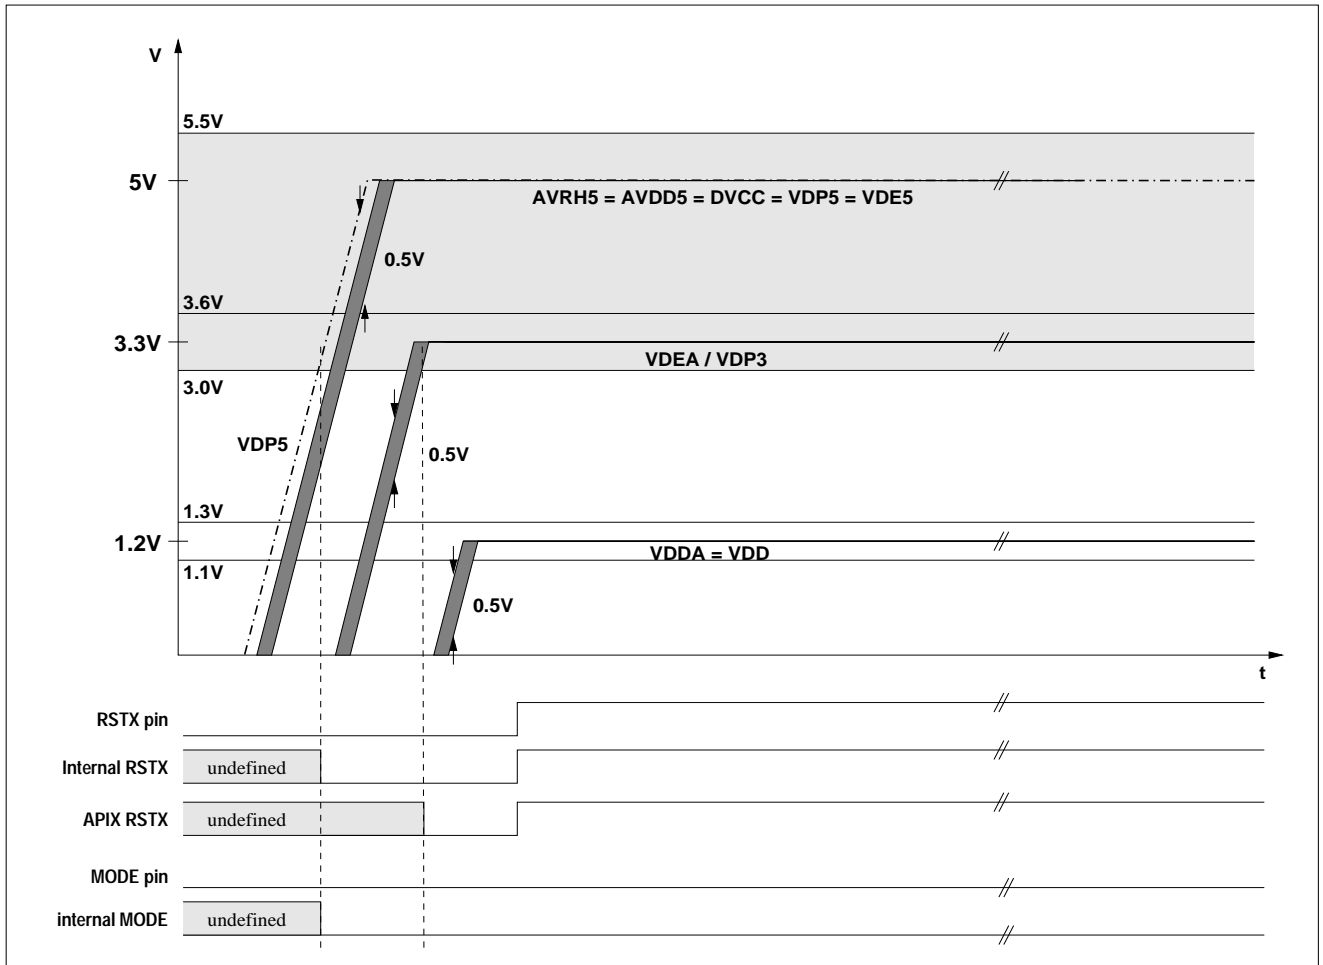

If DV_{CC} is not set to the same voltage level as AV_{DD5} , the ZPD functionality of SMC pins cannot be used.

8.4 Power on sequence

At any time, the difference between the power supply pins belonging to the same voltage level must not exceed 0.5V. This especially applies to the power on sequence. Otherwise, the risk of latchup will increase. Figure 8-1 shows the power on sequence and the groups of power supply that might be used, depending on the actual application.

Furthermore, V_{DP5} supply must be switched on before any other power supply or at least at the same time. The following conditions must be fulfilled at any moment:

1. The voltage of V_{DP5} must be higher or equal than the voltage on V_{DE5} , AV_{DD5} and AV_{RH5} .
2. For MB9DF126, MB9DF126B the voltage of V_{DP3} must be higher or equal than the voltage on V_{DD} and V_{DDA} . In particular, V_{DP3} must not be switched off for saving power.
3. The supply voltage for MODE and RSTX pins must reach the minimum operational value before switching on core voltage supply.
4. APIX module, which is supplied by V_{DEA} , must be able to receive a reset signal from the core domain, so the corresponding power supply must be within the operational range while the reset occurs.

Figure 8-1: Power on sequence

8.5 Pin State while Power-On-Reset

The following table shows the state of output/bidirectional pins during Power-On-Reset. For subsequent reset or power saving states, the pin state can be programmed according to the possibilities listed in HWM. Before software execution is started, however, the user must pay attention to the listed behavior.

8.6 Crystal oscillator circuit

Noise in proximity to the XTAL0/X0/X0A and XTAL1/X1/X1A pins can cause the device to operate abnormally. Printed circuit boards should be designed so that the XTAL0/X0/X0A and XTAL1/X1/X1A pins, and crystal oscillator, as well as bypass capacitors connected to ground, are located near the device and ground.

It is recommended that the printed circuit board layout be designed such that the XTAL0/X0/X0A and XTAL1/X1/X1A pins are surrounded by ground plane for the stable operation.

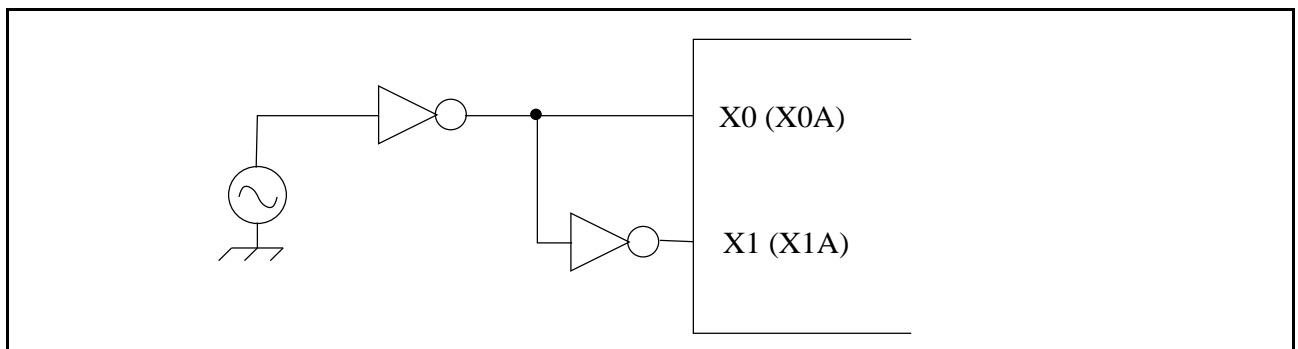

Please request the oscillator manufacturer to evaluate the related characteristics of the crystal and this device.

8.7 Notes on using external clock

8.7.1 Opposite phase clock supply: Oscillation Mode

When using the external clock, it is possible to simultaneously supply the XTAL0/X0/X0A and XTAL1/X1/X1A pins. In the described combination XTAL0/X0/X0A should be supplied with a clock signal which has the opposite phase to the XTAL1/X1/X1A pins. However, in this case the stop mode (oscillation stop mode) must not be used (This is because the XTAL1/X1/X1A pin stops at "H" output in STOP mode).

With opposite phase supply at XTAL0/X0 and XTAL1/X1, a frequency up to 16 MHz is possible.

Figure 8-2: Example of using opposite phase supply

8.7.2 Single phase clock supply

For lower frequencies, up to 4 MHz, it is possible to supply a single phase clock at XTAL0/X0.

Figure 8-3: Example of using single phase supply

8.7.3 Single phase clock supply: Fast Clock Input Mode

When a high frequency clock needs to be fed, it is possible to directly supply a single phase clock at XTAL0/X0. For this mode:

- SYSC_SPCCFGR:FCIMEN bit must be set to "1".
- the input clock must have 50% duty cycle.

Figure 8-4: Example of using Fast Clock Input Mode

8.8 Unused sub clock signal

If the pins X0A and X1A are not connected to an oscillator, a pull-down resistor must be connected on the X0A pin and the X1A pin must be left open.
